In algebraic geometry, a Calabi–Yau manifold, also known as a Calabi–Yau space, is a particular type of manifold which has properties, such as Ricci flatness, yielding applications in theoretical physics. Particularly in superstring theory, the extra dimensions of spacetime are sometimes conjectured to take the form of a 6-dimensional Calabi–Yau manifold, which led to the idea of mirror symmetry. Their name was coined by Candelas et al. (1985), after Eugenio Calabi (1954, 1957) who ...

The second studies Calabi-Yau manifolds and mirror symmetry, using algebraic geometry. The final part describes compact hyperkahler manifolds, which have a geometric structure very closely related to Calabi-Yau manifolds. The book is an introduction to a very active field of research, on the boundary between mathematics and physics.

'Calabi-Yau manifolds and related geometries', by Mark Gross, Daniel Huybrechts and Dominic Joyce There are many texts concerning the aspects of mirror symmetry having to do with variations of Hodge structure and counting curves, but only difficult research articles about the more recent geometry of mirror symmetry having to do with D-branes, homological mirror symmetry and torus fibrations.

Review of 'Calabi-Yau manifolds and related geometries'

Moore (2007) has shown that Calabi-Yau manifolds with complex structure located at an attractor fixed point on the moduli space exhibit interesting arithmetic properties. Calabi-Yau Manifolds in Physics. Calabi-Yau manifolds admit Kähler metrics with vanishing Ricci curvatures. They are solutions of the Einstein field equation with no matter. The theory of motions of loops inside a Calabi-Yau manifold provide a model of a conformal field theory.

One benefit of the Calabi-Yau manifolds was that the geometry of the folded dimensions gives rise to different types of observable particles in our universe. If the Calabi-Yau shape has three holes (or rather higher-dimensional analogs of holes), three families of particles will be predicted by the Standard Model of particle physics.

In particular, a Calabi-Yau (CY) manifold is a (compact) Ka'hler manifold with vanishingRicci curvature and so a vacuum solutionof the Einsteinequations. They have a prominent role in superstringtheory and have been a central focus in bothcontemporary mathematicsand math- ematical physics.

As special classes of compact complex manifolds, Calabi-Yaus and Fanos admit some features that make them easier to study than other classes. Calabi-Yaus satisfy a particularly strong PDE that Ric = 0, the Ricci tensor of a metric vanishes.

Yau's so-lution of the Calabi conjecture [22] produces a unique Calabi-Yau metric in each K ahler class on a compact K ahler manifold Xwith vanishing rst Chern class. These metrics have local holonomy group contained in SU(n). They are fundamental objects in geometry. Yau's original construction is based on solving a fully nonlinear complex

Calabi-Yau spaces are complex spaces with a vanishing first Chern class, or equivalently, with trivial canonical bundle (canonical class). They are used to construct possibly realistic (super)string models and are thus being studied vigorously in the recent physics literature.In the main part of the Book, collected and reviewed are relevant results on (1) several major techniques of constructing such spaces and (2) computation of physically relevant quantities such as massless field spectra and their Yukawa interactions. Issues of (3) stringy corrections and (4) moduli space and its geometry are still in the stage of rapid and continuing development, whence there is more emphasis on open problems here. Also is included a preliminary discussion of the conjectured universal moduli space and related open problems. Finally, several detailed models and sample computations are included throughout the Book to exemplify the techniques and the general discussion.The Book also contains a Lexicon (28 pages) of 150 assorted terms, key-words and main results and theorems, well suited for a handy reference. Although cross-referenced with the main part of the Book, the Lexicon can also be used independently.The level of mathematics is guided and developed between that of the popular Physics Reports of Eguchi, Gilkey and Hanson and the book Superstrings (Vol. 2) by Green, Schwarz and Witten on one end and Principles of Algebraic Geometry of Griffiths and Harris on the other.This is the first systematic exposition in book form of the material on Calabi-Yau spaces, related mathematics and the physics application, otherwise scattered through research articles in journals and conference proceedings.

Edward Witten Physics Today "The book by Hübsch is the first and only available monography, bringing together the mathematical results and presenting them in a form useful for the physicists. It is written in a light vein and often manages to simplify the mathematics, making them more palatable to physics users. An essential tool for workers on strings, supergravity and related topics." Yuval Ne'eman Tel Aviv Univ. "This book is full of interesting and illustrative examples. Here one can see the techniques and theorems of algebraic geometry in action. It is also written with a great deal of style. Though apparently for physicists, I would highly recommend it for mathematicians and especially for students of algebraic geometry. It is not easy to write for both mathematicians and physicists — I would say that this is an admirable example of such writing. Reading it, you will find that these manifolds are truly exciting creatures." Michael Eastwood University of Adelaide

From the author's preface: 'New manifolds are being created every moment, joining the menagerie. . . Our task therefore becomes taxonomy in part, guiding the interested reader through the web of known Calabi-Yau manifolds and preparing the more adventurous reader for a voyage into the jungle with many more beasts to be discovered.' The focus is on techniques and methods which will have long-lasting application. Acidic paper. Annotation copyrighted by Book News, Inc., Portland, OR

String theory says we live in a ten-dimensional universe, but that only four are accessible to our everyday senses. According to theorists, the missing six are curled up in bizarre structures known as Calabi-Yau manifolds. In The Shape of Inner Space, Shing-Tung Yau, the man who mathematically proved that these manifolds exist, argues that not only is geometry fundamental to string theory, it is also fundamental to the very nature of our universe. Time and again, where Yau has gone, physics has followed. Now for the first time, readers will follow Yau's penetrating thinking on where we've been, and where mathematics will take us next. A fascinating exploration of a world we are only just beginning to grasp, The Shape of Inner Space will change the way we consider the universe on both its grandest and smallest scales.
